Causality, Seriousness, and Expectedness

Assess sample cases using a transparent causality method and regulatory seriousness criteria.

Objective

Apply structured safety reasoning while keeping seriousness, severity, and causality distinct.

Deliverable

Completed assessment matrix with written rationale for every classification.

Do these steps to pass

- Apply the Naranjo or WHO-UMC framework to each sample case.
- Classify seriousness criteria and explain the reporting implication.
- Assess expectedness against the supplied reference document.
- Write a concise rationale for every classification.
- Complete the quality-control checklist.

Submission

Submit one public or view-only link. Put supporting files in the same repository, folder, or project page so one link is enough.

Key distinction

- Causality is not the same as seriousness.
- Severity/intensity is not the same as regulatory seriousness.
- Expectedness is assessed only against the supplied reference.
- Do not add facts that are absent from a case.

Training note

The actual screenshot mentions a fictional Velunex reference and four cases, but those source files were not attached here. This package therefore contains clearly labelled simulated training cases/reference material.
